- Track all traceable & Untraceable assets
- Optimized Supply Chain
- Optimized space and Lower operation Expenses

Benefits

Warehouse Management

Operations in a warehouse include order sorting, bagging, and dispatching. It always provides complete visibility of the warehouse along with the location each order is placed. Warehouse management operates with real-time data, allowing the organization to manage the most current information of each order from the time of arrival..

Shipping Management

Our Solutions will provide you to manage the shipment of the products to the customer. Based on the Zone the shipment will be tagged with all the relevant information i.e. Shipper details delivery details etc. Through the platform, the admin can allocate multiple shipments to a single employee for delivery.

Order Management

HyperNet Order Management module will notify your order regardless of how many channels are there, all orders will process in a unified order queue. The solution will track the order in real-time and return order management along with the authorization can be easily done. All the orders will be tagged while doing shipment. Our Solution will provide you with the tagged features in terms of barcode, and RFID tag. All these tags will be marked on assets which will carry all the details of assets which include shipment details, PO details, and other information as well. For the Admin, all information related to orders will be available with the supporting stats for a quick glance. Using this system, you can increase monitor and control all the order in a single view. Monthly/ weekly stats and reports can also be viewed.
